LIEB-THIRRING TYPE INEQUALITIES FOR NON-SELFADJOINT PERTURBATIONS OF MAGNETIC SCHRÖDINGER OPERATORS

DIOMBA SAMBOU

Abstract. Let $H := H_0 + V$ and $H_\perp := H_{0,\perp} + V$ be respectively perturbations of the free Schrödinger operators H_0 on $L^2\big(\mathbb{R}^{2d+1}\big)$ and $H_{0,\perp}$ on $L^2\big(\mathbb{R}^{2d}\big)$, $d \geq 1$ with constant magnetic field of strength $b > 0$, and V is a complex relatively compact perturbation. We prove Lieb-Thirring type inequalities for the discrete spectrum of H and $H_\perp$. In particular, these estimates give *a priori* information on the distribution of eigenvalues around the Landau levels of the operator, and describe how fast sequences of eigenvalues converge.

1. Introduction

Let $\mathbf{x} := (X_\perp, x) \in \mathbb{R}^{2d+1}$ be the cartesian coordinates, with $d \geq 1$ and $X_\perp := (x_1, y_1, \dots, x_d, y_d) \in \mathbb{R}^{2d}$. Let $b > 0$ be a constant and consider

$$H_{0,\perp} := \sum_{j=1}^{d} \left\{ \left(D_{x_j} + \frac{1}{2} b y_j \right)^2 + \left(D_{y_j} - \frac{1}{2} b x_j \right)^2 \right\}, \tag{1.1}$$

$$H_0 := H_{0,\perp} + D_x^2, \qquad D_\nu := -i \frac{\partial}{\partial \nu}, \tag{1.2}$$

the Schrödinger operators with constant magnetic field. Note that in the $2d+1$ dimensional case, *i.e.* H_0, the magnetic field $B : \mathbb{R}^{2d+1} \to \mathbb{R}^{2d+1}$ is pointing in the x-direction: $B = (0, \dots 0, b)$. So $X_\perp = (x_1, y_1, \dots, x_d, y_d) \in \mathbb{R}^{2d}$ are the variables on the plane perpendicular to the magnetic field.

The selfadjoint operators $H_{0,\perp}$ and H_0 are originally defined on $C_0^\infty\big(\mathbb{R}^n\big)$ for $n = 2d$ and $n = 2d+1$ respectively, and then closed in $L^2\big(\mathbb{R}^n\big)$. It is well known (see e.g. [8]) that the spectrum of the operator $H_{0,\perp}$ consists of the increasing sequence of Landau levels Λ_j, $j \in \mathbb{N} := \{0, 1, 2 \dots\}$:

$$\begin{cases} \Lambda_0 = bd \\ \Lambda_j = \inf \Big\{ r \in \mathbb{R} : r > \Lambda_{j-1},\ r = b \sum_{k=1}^{d} (2s_k - 1),\ (s_1, \dots, s_d) \in \mathbb{N}_*^d \Big\}, \end{cases}$$

and the multiplicity of each eigenvalue Λ_j is infinite. We see that for any j

$$\Lambda_j = b(d + 2j). \tag{1.3}$$

Key words and phrases. Magnetic Schrödinger operators, Lieb-Thirring type inequalities, non-selfadjoint relatively compact perturbations.

In the sequel we put $E := \{\Lambda_j\}_{j\in\mathbb{N}}$ for the set of Landau levels. Since the operator H_0 can be written in $L^2\big(\mathbb{R}^n\big) = L^2\big(\mathbb{R}^{2d}\big) \otimes L^2\big(\mathbb{R}\big)$ as

$$H_0 = H_{0,\perp} \otimes I + I \otimes D_x^2,$$

the spectrum of H_0 is absolutely continuous, equals $[\Lambda_0, +\infty)$, and has an infinite set of thresholds Λ_j, $j \in \mathbb{N}$.

On the domains of H_0 and $H_{0,\perp}$, we introduce the perturbed operators

$$H := H_0 + V \quad \text{and} \quad H_\perp := H_{0,\perp} + V, \tag{1.4}$$

where $V : \mathbb{R}^n \to \mathbb{C}$ is a non-selfadjoint perturbation for $n = 2d + 1$ and $n = 2d$ respectively. Everywhere in this article, we identify V with the multiplication operator by the function V. To simplify in below, by $\mathcal{H}_0$ we mean the free operators H_0 and $H_{0,\perp}$, and by $\mathcal{H}$ we mean H and $H_\perp$ defined by (1.4). So let

$$N(\mathcal{H}) := \{(\mathcal{H}f, f) : f \in \mathrm{dom}(\mathcal{H}), \|f\|_{L^2} \leq 1\}$$

be the numerical range of $\mathcal{H}$. It is well known (see e.g. [5], Lemma 9.3.14) that the spectrum $\sigma(\mathcal{H})$ of $\mathcal{H}$ satisfies

$$\sigma(\mathcal{H}) \subseteq \overline{N(\mathcal{H})}.$$

Thus, if the perturbation V is bounded we can easily verify that

$$\sigma(\mathcal{H}) \subseteq \overline{N(\mathcal{H})} \subset \big\{\lambda \in \mathbb{C} : \ \mathrm{Re}\lambda \geq -\|V\|_\infty \ \text{ and } \ |\mathrm{Im}\lambda| \leq \|V\|_\infty\big\}. \tag{1.5}$$

Assume that V is relatively compact with respect to $\mathcal{H}_0$. Then it follows from the Weyl criterion that $\sigma_{\mathrm{ess}}(H) = [\Lambda_0, +\infty)$ and $\sigma_{\mathrm{ess}}(H_\perp) = \{\Lambda_j\}_{j\in\mathbb{N}}$. Here $\sigma_{\mathrm{ess}}(\mathcal{H})$ is the essential spectrum of the operator $\mathcal{H}$. In the sequel, we denote by $\sigma_d(\mathcal{H})$ the discrete spectrum of $\mathcal{H}$, *i.e.*, the set of isolated eigenvalues of $\mathcal{H}$ that can only accumulate on $\sigma_{\mathrm{ess}}(\mathcal{H})$. For a separable Hilbert space X, we denote by $S_q(X)$, $q \in [1, +\infty)$ the Schatten-Von Neuman classes of compact linear operators L for which the norm $\|L\|_q := (\mathrm{Tr}\,|L|^q)^{1/q}$ is finite. Through this paper, we consider non-selfadjoint electric potentials V bounded and satisfying the following estimates:

$$\begin{aligned} |V(\mathbf{x})| \leq &\ \ CF(\mathbf{x})G(x), && \text{if} \quad n = 2d + 1 \\ |V(X_\perp)| \leq &\ \ CF(X_\perp), && \text{if} \quad n = 2d, \end{aligned} \tag{1.6}$$

where $C > 0$ is a constant in both cases, F and G are two positive functions satisfying $F \in L^p(\mathbb{R}^n)$ for $p \geq 2$, and $G \in \big(L^2 \cap L^\infty\big)\big(\mathbb{R}\big)$. Under these assumptions, we obtain some estimates of the p-Schatten norm of the sandwiched resolvents $F(H_0 - \lambda)^{-1}G$ and $F(H_{0,\perp} - \lambda)^{-1}$ (see Lemma 3.1 and Lemma 6.1, respectively). Furthermore, we use these estimates to obtain quantitative bounds on $\sigma_d(\mathcal{H})$. In particular, these estimates give *a priori* information on the distribution of eigenvalues around the Landau levels of the operator. Most of known results on $\sigma_d(\mathcal{H})$ deal with selfadjoint perturbations V and investigate the asymptotic behaviour of $\sigma_d(\mathcal{H})$ near the boundary points of its essential spectrum. This behaviour has been extensively studied in case where V admits power-like or slower decay at infinity (see [14], chapters 11 and 12, [20], [22], [23], [27], [28]). In [25] this behaviour is studied for potentials V decaying at infinity exponentially fast or having a compact support. For Landau Hamiltonians in exterior domains see [15], [18] and [21].

Typical example of potentials satisfying (1.6) for $n = 2d + 1$ is the special case of the relatively compact perturbations $V : \mathbb{R}^n \to \mathbb{C}$ satisfying the estimate

$$|V(\mathbf{x})| \leq C\,\langle X_\perp\rangle^{-m_\perp}\langle x\rangle^{-m}, \quad m_\perp > 0, \quad m > 1/2, \tag{1.7}$$

where $\langle y \rangle := \big(1+|y|^2\big)^{1/2}$, $y \in \mathbb{R}^d$, $d \geq 1$. Indeed, put $F(\mathbf{x}) = \langle X_\perp \rangle^{-m_\perp} \langle x \rangle^{-\nu}$ and $G(x) = \langle x \rangle^{-\tilde{m}}$, where $\nu + \tilde{m} = m$ with $\nu > 0$ and $\tilde{m} > 1/2$. Clearly for any $p \geq 2$ such that $pm_\perp > 2d$ and $p\nu > 1$, $F \in L^p(\mathbb{R}^n)$ and $G \in \big(L^2 \cap L^\infty\big)(\mathbb{R})$. We can also consider perturbations $V : \mathbb{R}^n \to \mathbb{C}$ verifying

$$|V(\mathbf{x})| \leq C \, \langle \mathbf{x} \rangle^{-\alpha}, \quad \alpha > 1/2. \tag{1.8}$$

Indeed, (1.8) implies that

$$|V(\mathbf{x})| \leq C \, \langle \mathbf{x} \rangle^{-(\alpha-\nu)} \langle x \rangle^{-\nu}, \quad \nu \in (1/2, \alpha).$$

So V satisfies (1.6) for any $p \geq 2$ with $p(\alpha - \nu) > n$. Note that (1.8) implies (1.7) with any $m \in (1/2, \alpha)$ and $m_\perp = \alpha - m$.

In the $2d$-dimensional case, assumption (1.6) is satisfied for example by class of potentials $V : \mathbb{R}^n \to \mathbb{C}$ such that

$$|V(X_\perp)| \leq C \, \langle X_\perp \rangle^{-m_\perp}, \quad m_\perp > 0, \tag{1.9}$$

$pm_\perp > 2d$ and $p \geq 2$. Under the assumption $m_\perp > 0$, $pm_\perp > 2d$ and $p \geq 2$, we can also consider power-like decaying electric potentials $V : \mathbb{R}^n \to \mathbb{C}$ satisfying the asymptotics

$$V(X_\perp) = \mathrm{v}\big(X_\perp / |X_\perp|\big) |X_\perp|^{-m_\perp} \big(1 + o(1)\big) \quad \text{as} \quad |X_\perp| \to \infty, \tag{1.10}$$

where v is a continuous function on $\mathbb{S}^1$ which is non-negative and does not vanish identically (see also [22] where V is selfadjoint).

To prove our first result (see Theorem 2.1), we first construct a holomorphic function whose zeros coincide with the eigenvalues of H. Moreover, we use a result by Borichev, Golinskii and Kupin [3] and complex analysis methods to get information on these zeros. Similar techniques are used in [6] and [7] for non-magnetic Schrödinger operators H with $\sigma_{\text{ess}}(H) = [0, +\infty)$, and Jacobi matrices J with $\sigma_{\text{ess}}(J) = [-2, 2]$. In both situations, the essential spectrum has a finite number of thresholds (0 for the first and -2, 2 for the second). Since in our case $\sigma_{\text{ess}}(H) = [\Lambda_0, +\infty)$ with an infinite set of thresholds Λ_j, we are led to introduce appropriate modifications to the above techniques to prove our results. More precisely, we will obtain two types of estimates. First, we bound the sums depending on parts of $\sigma_d(\mathcal{H})$ concentrated around a Landau level (see Proposition 5.1) using the Schwarz-Christoffel formula. Second, we get global estimates summing up the previous bounds with appropriate weights. This is to compare to results of [6] and [7], where global estimates were obtained directly by mapping conformally $\overline{\mathbb{C}} \setminus [0, +\infty)$ and $\overline{\mathbb{C}} \setminus [-2, 2]$ onto the unit disk respectively (see also [3]). To prove our second main result (see Theorem 2.2), we reason similarly to [12]; in particular, we use a recent result by Hansmann [13] and a technical distorsion Lemma (see Lemma 6.2).

The paper is organized as follows. In Section 2, we formulate our main results and we discuss some of their immediate consequences on the discrete spectrum of the operators H and $H_\perp$ defined by (1.4). Sections 3, 4 and 5 are devoted to the $(2d+1)$-Schrödinger operators H_0 and H. In Section 3, we establish estimates on appropriate sandwiched resolvents. Section 4 contains auxiliary material as the construction of a holomorphic function whose zeros coincide with the eigenvalues of H in $\mathbb{C} \setminus [\Lambda_0, +\infty)$, and the presentation of appropriate tools of complex analysis. In Section 5, we prove a local bound on the eigenvalues of the operator H (see

Proposition 5.1) and derive the proof of Theorem 2.1 from it. Section 6 is devoted to the $2d$-Schrödinger operators $H_{0,\perp}$ and $H_\perp$, and we prove Theorem 2.2.

2. MAIN RESULTS

In this section and elsewhere in this paper, for any $r \in \mathbb{R}$ we denote by $r_+ := \max(r, 0)$ and by $[r]$ its integer part. Otherwise, each $\lambda \in \sigma_d(\mathcal{H})$ is considering accordingly to its algebraic multiplicity, where $\mathcal{H}$ is the operator H or $H_\perp$ defined by (1.4).

2.1. The $2d+1$ dimensional case.

We obtain a Lieb-Thirring type inequality for the discrete spectrum of the $(2d+1)$-Schrödinger operator H defined by (1.4). The following theorem is proved in Section 5.

Theorem 2.1. *Let $H = H_0 + V$ with V satisfying (1.6) for $n = 2d+1$, $d \geq 1$. Assume that $F \in L^p\big(\mathbb{R}^n\big)$ with $p \geq 2\big[\frac{d}{2}\big] + 2$ and $G \in \big(L^2 \cap L^\infty\big)(\mathbb{R})$. Define*

$$K := \|F\|_{L^p}^p \big(\|G\|_{L^2} + \|G\|_{L^\infty}\big)^p \big(1 + \|V\|_\infty\big)^{d + \frac{p}{2} + \frac{3}{2} + \varepsilon}. \tag{2.1}$$

for $0 < \varepsilon < 1$. Then we have

$$\sum_{\lambda \in \sigma_d(H)} \frac{\operatorname{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{p}{2}+1+\varepsilon} \operatorname{dist}(\lambda, E)^{(\frac{p}{4}-1+\varepsilon)_+}}{(1+|\lambda|)^\gamma} \leq C_0 K, \tag{2.2}$$

where E is the set of Landau levels defined by (1.3), $\gamma > d + \frac{3}{2}$ and $C_0 = C(p, b, d, \varepsilon)$ is a constant depending on p, b, d and ε.

Since for any $\tau > 0$ with $|\lambda| \geq \tau$ we have

$$\frac{1}{1+|\lambda|} = \frac{1}{|\lambda|} \frac{1}{1+|\lambda|^{-1}} \geq \frac{1}{|\lambda|} \frac{1}{1+\tau^{-1}}, \tag{2.3}$$

the following holds.

Corollary 2.1. *Under the assumptions and the notations of Theorem 2.1, the following bound holds for any $\tau > 0$*

$$\sum_{\substack{\lambda \in \sigma_d(H) \\ |\lambda| \geq \tau}} \frac{\operatorname{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{p}{2}+1+\varepsilon} \operatorname{dist}(\lambda, E)^{(\frac{p}{4}-1+\varepsilon)_+}}{|\lambda|^\gamma} \leq C_0 \left(1 + \frac{1}{\tau}\right)^\gamma K. \tag{2.4}$$

Theorem 2.1 has immediate corollaries on sequences $(\lambda_k) \in \sigma_d(H)$ that converge to some $\lambda^* \in \sigma_{\text{ess}}(H) = [\Lambda_0, +\infty)$. Without loss of generality, we can consider a subsequence and assume that either (i) or (ii) below happens:

(i) $\lambda^* \in [\Lambda_0, +\infty) \setminus E$.
(ii) $\lambda^* \in E$.

In case (i), the sequence $\big(\operatorname{dist}(\lambda_k, E)\big)_k$ is positive and does not converge to 0. Then estimate (2.2) implies that

$$\sum_k |\operatorname{Im} \lambda_k|^{\frac{p}{2}+1+\varepsilon} < \infty. \tag{2.5}$$

In case (ii), we consider the λ_k tending to a Landau level non-tangentially $\big($*i.e.* $|\mathrm{Re}\,\lambda_k - \lambda^*| \le C\,|\mathrm{Im}\,\lambda_k|$ with some $C > 0\big)$ and such that $\mathrm{dist}(\lambda_k, E)$ is small enough. We then can claim that (2.2) implies the estimate

$$\sum_k \mathrm{dist}(\lambda_k, E)^{\frac{p}{2}+1+\varepsilon+(\frac{p}{4}-1+\varepsilon)_+} < \infty. \tag{2.6}$$

So estimates (2.5) and (2.6) allows us to claim that *a priori* the eigenvalues are less densely distributed near Landau levels than elsewhere in the essential spectrum of the operator H.

Let us give some remarks about the three-dimensional case on selfadjoint perturbations V satisfying the condition

$$V \le 0, \quad C^{-1}\langle \mathbf{x}\rangle^{-\alpha} \le |V(\mathbf{x})| \le C\,\langle \mathbf{x}\rangle^{-\alpha}, \quad \alpha > 0 \tag{2.7}$$

with some constant $C > 1$. Let (λ_k) be a sequence of eigenvalues of H accumulating to Λ_0 from the left. Suppose that it describes all eigenvalues $\lambda \in \sigma_d(H) \cap (\Lambda_0 - r, \Lambda_0)$ with some $r > 0$. Under some supplementary regularity assumptions on V (see [28], Theorem 1), we have

$$\sum_k \mathrm{dist}\big(\lambda_k, \Lambda_0\big)^p = \int_0^r p\lambda^{p-1} N\big(\Lambda_0 - \lambda, H\big) d\lambda < \infty \tag{2.8}$$

for $p > 3/\alpha - 1/2$ if $\alpha < 2$ and $p(\alpha - 1) > 1$ if $\alpha > 2$. Here $N\big(\Lambda_0 - \lambda, H\big)$ is the number of eigenvalues of H less than $\Lambda_0 - \lambda$ repeated according to their multiplicity. Hence in (2.6), conditions on p are not optimal at least for selfadjoint perturbations V of definite sign as above. Indeed, it can be checked that if the potential V satisfies (2.7) with $\alpha > 1/2$ $\big($this is to compare to (1.8)$\big)$, then $p/2 + 1 + \varepsilon > 3/\alpha - 1/2$ if $\alpha < 2$ and $p/2 + 1 + \varepsilon > 1/(\alpha - 1)$ if $\alpha > 2$.

By Theorem 2.1, we can also get information on sequences $(\lambda_k) \in \sigma_d(H)$ that diverge. Consider for example sequences (λ_k) satisfying for any k

$$\mathrm{dist}\big(\lambda_k, [\Lambda_0, +\infty)\big) \ge \eta \tag{2.9}$$

for some $\eta > 0$. Then estimate (2.4) implies that

$$\sum_k \frac{1}{|\lambda_k|^\gamma} < \infty, \tag{2.10}$$

where $\gamma > d + \frac{3}{2}$. This means that $|\lambda_k|$ converge to infinity sufficiently fast.

2.2. **The $2d$ dimensional case.**

The following theorem is proved in Section 6 and concerns the $2d$-Schrödinger operator $H_\perp$ defined by (1.4). We obtain a Lieb-Thirring type inequality for the discrete spectrum of $H_\perp$.

Theorem 2.2. *Let $H_\perp = H_{0,\perp} + V$ with V satisfying* (1.6) *for $n = 2d$, $d \ge 1$. Assume that $F \in L^p\big(\mathbb{R}^n\big)$ with $p \ge 2\big[\frac{d}{2}\big] + 2$. Then the following holds*

$$\sum_{\lambda \in \sigma_d(H_\perp)} \frac{\mathrm{dist}\big(\lambda, E\big)^p}{\big(1 + |\lambda|\big)^{2p}} \le C_1 \|F\|_{L^p}^p \big(1 + \|V\|_\infty\big)^{2p}, \tag{2.11}$$

where E is the set of Landau levels defined by (1.3)*, and $C_1 = C(p, b, d)$ is a constant depending on p, b and d.*

Since for any $\tau > 0$ with $|\lambda| \geq \tau$ the lower bound (2.3) holds, we have the following corollary.

Corollary 2.2. *Under the assumptions and the notations of Theorem* 2.2*, the following bound holds for any* $\tau > 0$

$$\sum_{\substack{\lambda \in \sigma_d(H_\perp) \\ |\lambda| \geq \tau}} \frac{\mathrm{dist}\big(\lambda, E\big)^p}{|\lambda|^{2p}} \leq C_1 \left(1 + \frac{1}{\tau}\right)^{2p} \|F\|_{L^p}^p \big(1 + \|V\|_\infty\big)^{2p}. \tag{2.12}$$

Theorem 2.2 has immediate corollaries on sequences $(\lambda_k) \in \sigma_d(H)$ that converge to some $\lambda^* \in \sigma_{\mathrm{ess}}(H) = E$. Indeed, by (2.11)

$$\sum_k \mathrm{dist}\big(\lambda_k, E\big)^p < \infty, \tag{2.13}$$

which *a priori* means that the accumulation of eigenvalues near the Landau levels decreases with decreasing p.

Note that if the perturbation V satisfies (1.10), the finiteness of the sum in (2.13) hols for $p > \max(2d/m_\perp, 2)$, $m_\perp > 0$. However, it is convenient to mention that in the two-dimensional case *i.e.* $d = 1$, if $V \geq 0$ is selfadjoint and satisfies (1.10) with $m_\perp > 1$, the condition $p > \max(2/m_\perp, 1)$ is optimal for the finiteness of the sum in (2.13). This is a direct consequence of Theorem 2.6 of [22], assuming some supplementary regularity assumptions on V. Indeed if $\lambda' \in (\Lambda_j, \Lambda_{j+1})$, $j \geq 0$ and (λ_k) an infinite sequence of discrete eigenvalues of $H_\perp$ accumulating to the Landau level Λ_j from the right, then

$$\sum_k \mathrm{dist}\big(\lambda_k, \Lambda_j\big)^p = \int_0^{\lambda' - \Lambda_j} p\lambda^{p-1} N\big(\Lambda_j + \lambda, \lambda', H_\perp\big) d\lambda < \infty \tag{2.14}$$

if and only if $pm_\perp > 2$. The quantity $N\big(\Lambda_j + \lambda, \lambda', H_\perp\big)$ is the number of eigenvalues of $H_\perp$ in $(\Lambda_j + \lambda, \lambda')$ repeated according to their multiplicity. Analogous result holds if we consider the eigenvalues of $H_\perp = H_{0,\perp} - V$ accumulating to Λ_j from the left. Namely, (2.14) remains valid if we replace $N\big(\Lambda_j + \lambda, \lambda', H_\perp\big)$ by $N\big(\lambda'', \Lambda_j - \lambda, H_\perp\big)$ with some $\lambda'' \in (\Lambda_{j-1}, \Lambda_j)$ if $j > 0$, or by $N\big(\Lambda_j - \lambda, H_\perp\big)$ if $j = 0$ with $N\big(\Lambda_j - \lambda, H_\perp\big)$ defined as in (2.8).

Also in the two-dimensional case and selfadjoint perturbations $V \in C\big(\mathbb{R}^2, \mathbb{R}\big)$ satisfying (1.9) with $m_\perp > 1$, we have the asymptotic property

$$\sum_k \mathrm{dist}\big(\lambda_k, \Lambda_j\big)^p = o\Big(j^{-(p-1)/2}\Big), \quad j \longrightarrow \infty, \tag{2.15}$$

for any $p \geq 1$ such that $p(m_\perp - 1) > 1$. This is a direct consequence of Lemma 1.5 and Theorem 1.6 of [20].

3. Estimate of the sandwiched resolvents of H_0 and H

In order to estimate the resolvents of the operators H_0 and H, let us fix some notations. Denote by

$$\mathbb{C}_+ := \{z \in \mathbb{C} : \mathrm{Im}\, z > 0\} \quad \text{and} \quad \mathbb{C}_- := \{z \in \mathbb{C} : \mathrm{Im}\, z < 0\}. \tag{3.1}$$

For Λ_j defined by (1.3) and $\lambda \in \mathbb{C} \setminus [\Lambda_0, +\infty)$, we have

$$(H_0 - \lambda)^{-1} = \sum_{j \in \mathbb{N}} p_j \otimes \Big(D_x^2 + \Lambda_j - \lambda \Big)^{-1}, \tag{3.2}$$

where p_j is the orthogonal projection onto $\ker(H_{0,\perp} - \Lambda_j)$. Recall that for $z \in \mathbb{C} \setminus [0, +\infty)$, the operator $\Big(D_x^2 - z \Big)^{-1}$ admits the integral kernel

$$\frac{i e^{i\sqrt{z}|x-x'|}}{2\sqrt{z}}, \tag{3.3}$$

if the branch of $\sqrt{z}$ is chosen so that $\operatorname{Im}\sqrt{z} \in \mathbb{C}_+$. In the sequel, we assume that the perturbation V satisfies assumption (1.6). We have the following lemma.

Lemma 3.1. *Let $n = 2d + 1$, $d \geq 1$ and $\lambda \in \mathbb{C} \setminus [\Lambda_0, +\infty)$. Assume that $F \in L^p\big(\mathbb{R}^n\big)$ with $p \geq 2\big[\frac{d}{2}\big] + 2$ and $G \in \big(L^2 \cap L^\infty\big)(\mathbb{R})$. Then there exists a constant $C = C(p, b, d)$ such that*

$$\big\| F(H_0 - \lambda)^{-1} G \big\|_p^p \leq \frac{C(1 + |\lambda|)^{d + \frac{1}{2}} K_1}{\operatorname{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{p}{2}} \operatorname{dist}(\lambda, E)^{\frac{p}{4}}}, \tag{3.4}$$

where E is the set of Landau levels defined by (1.3) *and*

$$K_1 := \|F\|_{L^p}^p \big(\|G\|_{L^2} + \|G\|_{L^\infty} \big)^p. \tag{3.5}$$

Proof. It suffices to prove the case $\lambda \in \mathbb{C}_+$. Constants are generic (changing from a relation to another).

(i): We show that (3.4) holds if p is even. Let us first prove that if $\operatorname{Re}\lambda < \Lambda_0$, then

$$\big\| F(H_0 - \lambda)^{-1} G \big\|_p^p \leq \frac{C(1 + |\lambda|)^{d + \frac{1}{2}} K_1}{\operatorname{dist}(\lambda, E)^{\frac{3p}{4}}}. \tag{3.6}$$

Using the identity

$$(H_0 - \lambda)^{-1} - \big(H_0 + 1 + |\lambda|\big)^{-1} = \big(H_0 + 1 + |\lambda|\big)^{-1} (1 + |\lambda| + \lambda)(H_0 - \lambda)^{-1},$$

one gets

$$(H_0 - \lambda)^{-1} = \big(H_0 + 1 + |\lambda|\big)^{-1} \big((1 + |\lambda| + \lambda)(H_0 - \lambda)^{-1} + I \big).$$

Then

$$\begin{aligned} \big\| F(H_0 - \lambda)^{-1} G \big\|_p^p \leq & \Big\| F\big(H_0 + 1 + |\lambda|\big)^{-1} \Big\|_p^p \\ & \times \Big\| \Big((1 + |\lambda| + \lambda)(H_0 - \lambda)^{-1} + I \Big) G \Big\|^p \end{aligned} \tag{3.7}$$

Since p is even, we can apply the diamagnetic inequality for the S_p class operators (Theorem 2.3 of [1] and Theorem 2.13 of [26]). We get

$$\Big\| F\big(H_0 + 1 + |\lambda|\big)^{-1} \Big\|_p^p \leq \big\| F(-\Delta + 1 + |\lambda|)^{-1} \big\|_p^p.$$

By Theorem 4.1 of [26],

$$\big\| F(-\Delta + 1 + |\lambda|)^{-1} \big\|_p^p \leq C(p) \, \|F\|_{L^p}^p \, \Big\| \Big(|\cdot|^2 + 1 + |\lambda| \Big)^{-1} \Big\|_{L^p}^p.$$

Since

$$\left\| \Big(|\cdot|^2 + 1 + |\lambda| \Big)^{-1} \right\|_{L^p}^p = C \int_0^\infty \frac{r^{2d} dr}{(r^2 + 1 + |\lambda|)^p} = C(p) \frac{(1 + |\lambda|)^{d+\frac{1}{2}}}{(1 + |\lambda|)^p},$$

then

$$\left\| F \big(H_0 + 1 + |\lambda| \big)^{-1} \right\|_p^p \leq C(p) \frac{(1 + |\lambda|)^{d+\frac{1}{2}}}{(1 + |\lambda|)^p} \left\| F \right\|_{L^p}^p . \tag{3.8}$$

Otherwise,

$$\begin{aligned} & \left\| \Big((1 + |\lambda| + \lambda)(H_0 - \lambda)^{-1} + I \Big) G \right\|^p \\ & \leq \Big(C \big(1 + |\lambda| \big) \left\| (H_0 - \lambda)^{-1} G \right\| + \left\| G \right\|_{L^\infty} \Big)^p . \end{aligned} \tag{3.9}$$

By (3.2), we have

$$\begin{aligned} \left\| (H_0 - \lambda)^{-1} G \right\| & = \underbrace{\left\| \sum_{j \in \mathbb{N}} p_j \otimes \Big(D_x^2 + \Lambda_j - \lambda \Big)^{-1} G \right\|}_{\text{direct sum}} \\ & \leq C \sup_j \left\| \Big(D_x^2 + \Lambda_j - \lambda \Big)^{-1} G \right\| . \end{aligned} \tag{3.10}$$

One has

$$\begin{aligned} \left\| \Big(D_x^2 + \Lambda_j - \lambda \Big)^{-1} G \right\| & \leq \left\| \Big(D_x^2 + \Lambda_j - \lambda \Big)^{-1} G \right\|_2 \\ & = \left\| G \Big(D_x^2 + \Lambda_j - \lambda \Big)^{-1} \right\|_2 . \end{aligned} \tag{3.11}$$

As above, by Theorem 4.1 of [26],

$$\left\| G \Big(D_x^2 + \Lambda_j - \lambda \Big)^{-1} \right\|_2^2 \leq C \left\| G \right\|_{L^2}^2 \left\| \Big(|\cdot|^2 + \Lambda_j - \lambda \Big)^{-1} \right\|_{L^2(\mathbb{R})}^2 .$$

Since $\operatorname{Re} \lambda < \Lambda_0$, we have for any $r \in \mathbb{R}$

$$\left| r^2 + \Lambda_j - \lambda \right|^2 \geq r^4 + \left| \lambda - \Lambda_j \right|^2 .$$

This implies that

$$\left\| \Big(|\cdot|^2 + \Lambda_j - \lambda \Big)^{-1} \right\|_{L^2}^2 \leq \left\| \Big(|\cdot|^4 + |\lambda - \Lambda_j|^2 \Big)^{-1} \right\|_{L^1(\mathbb{R})} \leq \frac{C}{|\lambda - \Lambda_j|^{\frac{3}{2}}},$$

so that

$$\left\| (H_0 - \lambda)^{-1} G \right\| \leq \frac{C \left\| G \right\|_{L^2}}{\operatorname{dist}(\lambda, E)^{\frac{3}{4}}} . \tag{3.12}$$

By (3.9) and (3.12), we have

$$\begin{aligned}\left\|\Big((1+|\lambda|+\lambda)(H_0-\lambda)^{-1}+I\Big)G\right\|^p &\le \left(\frac{C\,\|G\|_{L^2}\,(1+|\lambda|)}{\operatorname{dist}(\lambda,E)^{\frac{3}{4}}}+\|G\|_{L^\infty}\right)^p \\ &\le \frac{C(p,b,d)\Big(\|G\|_{L^2}+\|G\|_{L^\infty}\Big)^p\,(1+|\lambda|)^p}{\operatorname{dist}(\lambda,E)^{\frac{3p}{4}}},\end{aligned} \tag{3.13}$$

and (3.6) follows from (3.7), (3.8) and (3.13).

Now let us prove that if $\operatorname{Re}\lambda\ge\Lambda_0$, then

$$\left\|F(H_0-\lambda)^{-1}G\right\|_p^p\le\frac{C(1+|\lambda|)^{d+\frac{1}{2}}K_1}{|\operatorname{Im}\lambda|^{\frac{p}{2}}\operatorname{dist}(\lambda,E)^{\frac{p}{4}}}. \tag{3.14}$$

From (3.11), we compute the Hilbert-Schmidt norm of $G\Big(D_x^2+\Lambda_j-\lambda\Big)^{-1}$ with the help of its integral kernel (3.3). Thus for $\operatorname{Im}\sqrt{\lambda-\Lambda_j}>0$, we have

$$\left\|G\Big(D_x^2+\Lambda_j-\lambda\Big)^{-1}\right\|_2^2=\frac{C\|G\|_{L^2}^2}{\operatorname{Im}\sqrt{\lambda-\Lambda_j}\,|\lambda-\Lambda_j|}.$$

Now from

$$\operatorname{Im}\lambda=\operatorname{Im}(\lambda-\Lambda_j)=2\operatorname{Im}\sqrt{\lambda-\Lambda_j}\operatorname{Re}\sqrt{\lambda-\Lambda_j},$$

one deduces that

$$\begin{aligned}\left\|G\Big(D_x^2+\Lambda_j-\lambda\Big)^{-1}\right\|_2^2&=\frac{C\|G\|_{L^2}^2\operatorname{Re}\sqrt{\lambda-\Lambda_j}}{|\operatorname{Im}\lambda|\,|\lambda-\Lambda_j|}\\ &\le\frac{C\|G\|_{L^2}^2}{|\operatorname{Im}\lambda|\operatorname{dist}(\lambda,E)^{\frac{1}{2}}}.\end{aligned} \tag{3.15}$$

Combining (3.10), (3.11) and (3.15), one gets

$$\left\|(H_0-\lambda)^{-1}G\right\|\le\frac{C\|G\|_{L^2}}{|\operatorname{Im}\lambda|^{\frac{1}{2}}\operatorname{dist}(\lambda,E)^{\frac{1}{4}}}. \tag{3.16}$$

Finally by (3.9) and (3.16),

$$\left\|\Big((1+|\lambda|+\lambda)(H_0-\lambda)^{-1}+I\Big)G\right\|^p\le\frac{C(p)\Big(\|G\|_{L^2}+\|G\|_{L^\infty}\Big)^p(1+|\lambda|)^p}{|\operatorname{Im}\lambda|^{\frac{p}{2}}\operatorname{dist}(\lambda,E)^{\frac{p}{4}}}. \tag{3.17}$$

Now (3.14) follows from (3.7), (3.8) and (3.17). Hence estimates (3.6) and (3.14) show that (3.4) holds if p is even.

(ii): We prove that (3.14) holds for any $p\ge 2\big[\frac{d}{2}\big]+2$ using interpolation method. Clearly if p is as above, there exists even integers $p_0<p_1$ such that $p\in(p_0,p_1)$ with $p_0>d+1/2$. Now choose $s\in(0,1)$ such that $\frac{1}{p}=\frac{1-s}{p_0}+\frac{s}{p_1}$. For $i=0$, 1 consider the operator

$$L^{p_i}\big(\mathbb{R}^n\big)\ni F\xmapsto{T}F(H_0-\lambda)^{-1}G\in S_{p_i}.$$

By (i) proved above, estimate (3.4) holds for any $F \in L^{p_i}\big(\mathbb{R}^n\big)$. Let $C_i = C(p_i, b, d)$ be the constant in (3.4) and define

$$C(\lambda, p_i, d) := \frac{C_i^{\frac{1}{p_i}} \Big((1+|\lambda|)^{d+\frac{1}{2}}\Big)^{\frac{1}{p_i}} \Big(\|G\|_{L^2} + \|G\|_{L^\infty}\Big)}{\text{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{1}{2}} \, \text{dist}(\lambda, E)^{\frac{1}{4}}}.$$

Then by (3.4) for (i) proved above, we have $\|T\| \leq C(\lambda, p_i, d)$ for any $i = 0$, 1. Using the Riesz-Thorin Theorem (see e.g [11] Subsection 5 of Chapter 6, [24], [29], [17] Chapter 2), we can interpolate between p_0 and p_1 to get the extension $T : L^p\big(\mathbb{R}^{2d+1}\big) \longrightarrow S_p$ with

$$\|T\| \leq C(\lambda, p_0, d)^{1-s} C(\lambda, p_1, d)^s \leq \frac{C(p, b, d) \Big((1+|\lambda|)^{d+\frac{1}{2}}\Big)^{\frac{1}{p}} \Big(\|G\|_{L^2} + \|G\|_{L^\infty}\Big)}{\text{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{1}{2}} \, \text{dist}(\lambda, E)^{\frac{1}{4}}}.$$

In particular for any $F \in L^p\big(\mathbb{R}^n\big)$, we have

$$\|T(F)\|_p \leq \frac{C(p, b, d) \Big((1+|\lambda|)^{d+\frac{1}{2}}\Big)^{\frac{1}{p}} \Big(\|G\|_{L^2} + \|G\|_{L^\infty}\Big)}{\text{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{1}{2}} \, \text{dist}(\lambda, E)^{\frac{1}{4}}} \|F\|_{L^p}, \tag{3.18}$$

which implies estimate (3.4). This concludes the proof of the lemma. ■

Now let λ_0 be such that

$$\min\Big(|\text{Im}\,\lambda_0|, \text{dist}\big(\lambda_0, \overline{N(H)}\big)\Big) \geq 1 + \|V\|_\infty. \tag{3.19}$$

We have the following lemma.

Lemma 3.2. *Assume that* λ_0 *satisfies condition* (3.19). *Under the assumptions of Lemma* 3.1, *there exists a constant* $C = C(p)$ *such that*

$$\big\|F(H-\lambda_0)^{-1}G\big\|_p^p \leq C(1+|\lambda_0|)^{d+\frac{1}{2}} K_2, \tag{3.20}$$

where the constant K_2 *is defined by*

$$K_2 := \|F\|_{L^p}^p \|G\|_{L^\infty}^p. \tag{3.21}$$

Proof. Constants are generic (changing from a relation to another). From

$$(H-\lambda_0)^{-1} = (H_0-\lambda_0)^{-1}(H_0-\lambda_0)(H-\lambda_0)^{-1},$$

we deduce that

$$\begin{aligned} \big\|F(H-\lambda_0)^{-1}G\big\|_p^p &\leq \big\|F(H-\lambda_0)^{-1}\big\|_p^p \|G\|_{L^\infty}^p \\ &\leq \big\|F(H_0-\lambda_0)^{-1}\big\|_p^p \big\|(H_0-\lambda_0)(H-\lambda_0)^{-1}\big\|^p \|G\|_{L^\infty}^p. \end{aligned} \tag{3.22}$$

Using similar method to that of the proof of Lemma 3.1, one can show that

$$\big\|F(H_0-\lambda_0)^{-1}\big\|_p^p \leq \frac{C(1+|\lambda_0|)^{d+\frac{1}{2}} \|F\|_{L^p}^p}{|\text{Im}\,\lambda_0|^p}. \tag{3.23}$$

So (3.23) together with condition (3.19) on λ_0 give finally

$$\big\|F(H_0-\lambda_0)^{-1}\big\|_p^p \leq C(1+|\lambda_0|)^{d+\frac{1}{2}} \|F\|_{L^p}^p. \tag{3.24}$$

Otherwise, we have

$$\big\|(H_0-\lambda_0)(H-\lambda_0)^{-1}\big\| = \big\|I - V(H-\lambda_0)^{-1}\big\| \leq 1 + \|V\|_\infty \big\|(H-\lambda_0)^{-1}\big\|.$$

By Lemma 9.3.14 of [5],

$$\left\|(H-\lambda_0)^{-1}\right\| \leq \frac{1}{\operatorname{dist}\bigl(\lambda_0, \overline{N(H)}\bigr)}.$$

The assumption on λ_0 implies then that

$$\left\|(H_0-\lambda_0)(H-\lambda_0)^{-1}\right\| \leq 2. \tag{3.25}$$

Now (3.20) follows from (3.22), (3.24) and (3.25). ■

4. Preliminaries

4.1. **About the holomorphic function $f(\lambda)$.** In this subsection, we construct as in [6] a holomorphic function $f : \mathbb{C} \setminus [\Lambda_0, +\infty) \to \mathbb{C}$ whose zeros are the $\lambda \in \sigma_d(H)$.

Let $\lambda \in \mathbb{C} \setminus [\Lambda_0, +\infty)$. We have the identity

$$(H-\lambda)(H_0-\lambda)^{-1} = I + V(H_0-\lambda)^{-1}. \tag{4.1}$$

LHS of (4.1) is not invertible if and only if $H-\lambda$ is not invertible. Since V is a relatively compact perturbation, this happens if and only if $\lambda \in \sigma_d(H)$. So defining

$$T(\lambda) = V(H_0-\lambda)^{-1}, \tag{4.2}$$

we get for $\lambda \in \mathbb{C} \setminus [\Lambda_0, +\infty)$ that

$$\lambda \in \sigma_d(H) \Leftrightarrow I + T(\lambda) \ \text{ is not invertible.} \tag{4.3}$$

Otherwhise, assumption (1.6) for $n = 2d+1$ on the potential V implies that for any $\mathbf{x} = (X_\perp, x) \in \mathbb{R}^n$, $V(\mathbf{x}) = \mathcal{V}F(\mathbf{x})G(x)$ where $\mathcal{V}$ is a bounded operator. Thus, as in proof of Lemma 3.1, we can show that $T(\lambda) \in S_p$ for any $p \geq 2$. Let $\det_{\lceil p \rceil}\bigl(I+T(\lambda)\bigr)$ be the regularized determinant defined by

$$\det{}_{\lceil p \rceil}\bigl(I+T(\lambda)\bigr) := \prod_{\mu \in \sigma\left(T(\lambda)\right)} \left[(1+\mu)\exp\left(\sum_{k=1}^{\lceil p \rceil - 1} \frac{(-\mu)^k}{k}\right)\right], \tag{4.4}$$

where $\lceil p \rceil := \min\{n \in \mathbb{N} : n \geq p\}$. Hence (4.3) can be rewritten as (see e.g. [26], Chapter 9)

$$\lambda \in \sigma_d(H) \Leftrightarrow \det{}_{\lceil p \rceil}\bigl(I+T(\lambda)\bigr) = 0. \tag{4.5}$$

Let us define

$$f(\lambda) := \det{}_{\lceil p \rceil}\bigl(I+T(\lambda)\bigr). \tag{4.6}$$

The function f is holomorphic on $\mathbb{C} \setminus [\Lambda_0, +\infty)$ and then

$$\sigma_d(H) = \{\lambda \in \mathbb{C} \setminus [\Lambda_0, +\infty) : f(\lambda) = 0\}. \tag{4.7}$$

Moreover, the algebraic multiplicity of $\lambda \in \sigma_d(H)$ is equal to the order of λ as zero of the function f.

Let us proof the following lemma on $f(\lambda)$.

Lemma 4.1. *Let $\lambda \in \mathbb{C} \setminus [\Lambda_0, +\infty)$ and suppose that λ_0 satisfies* (3.19)*. Under the assumptions of Lemma* 3.1*, there exists $C = C(p, b, d)$ such that*

$$\log\left|\frac{f(\lambda)}{f(\lambda_0)}\right| \leq \frac{\Gamma_p C(1+|\lambda|)^{d+\frac{1}{2}} K_1}{\operatorname{dist}\bigl(\lambda, [\Lambda_0, +\infty)\bigr)^{\frac{p}{2}} \operatorname{dist}(\lambda, E)^{\frac{p}{4}}} + \Gamma_p C(1+|\lambda_0|)^{d+\frac{1}{2}} K_1, \tag{4.8}$$

where Γ_p *is some positive constant and* K_1 *is defined by* (3.5).

Proof. First, write $\frac{f(\lambda)}{f(\lambda_0)} = f(\lambda) \cdot f(\lambda_0)^{-1}$. Since

$$f(\lambda_0)^{-1} = \det{}_{\lceil p \rceil}\Big(I + V(H_0 - \lambda_0)^{-1}\Big)^{-1},$$

then passing to the inverse in (4.1), we get

$$f(\lambda_0)^{-1} = \det{}_{\lceil p \rceil}\Big(I - V(H - \lambda_0)^{-1}\Big).$$

This implies that

$$\begin{aligned} \left|\frac{f(\lambda)}{f(\lambda_0)}\right| &= \left|\det{}_{\lceil p \rceil}\Big(I + V(H_0 - \lambda)^{-1}\Big)\right| \cdot \left|\det{}_{\lceil p \rceil}\Big(I - V(H - \lambda_0)^{-1}\Big)\right| \\ &= \left|\det{}_{\lceil p \rceil}\Big(I + \mathcal{V}F(H_0 - \lambda)^{-1}G\Big)\right| \cdot \left|\det{}_{\lceil p \rceil}\Big(I - \mathcal{V}F(H - \lambda_0)^{-1}G\Big)\right|. \end{aligned} \tag{4.9}$$

Otherwise, for any $A \in S_{\lceil p \rceil}$, we have the estimate (see e.g. [26])

$$\left|\det{}_{\lceil p \rceil}(I + A)\right| \leq \mathrm{e}^{\Gamma_p \|A\|_p^p}.$$

Thus using (4.9), we get

$$\left|\frac{f(\lambda)}{f(\lambda_0)}\right| \leq \mathrm{e}^{C\Gamma_p\left(\|F(H_0-\lambda)^{-1}G\|_p^p + \|F(H-\lambda_0)^{-1}G\|_p^p\right)}. \tag{4.10}$$

So Lemma 3.1 and Lemma 3.2 together with the inequality $K_2 < K_1$ give (4.8). ■

In what below, we use a theorem about zeros of holomorphic functions in $\mathbb{D} := \{|z| < 1\}$ to study the zeros of the function f in $\mathbb{C}\backslash[\Lambda_0, +\infty)$. Recall that in our case the Landau levels Λ_j defined by (1.3) play the role of thresholds in $[\Lambda_0, +\infty)$. So to study the zeros of the function f in $\mathbb{C} \setminus [\Lambda_0, +\infty)$ or equivalently the eigenvalues of the operator H in $\mathbb{C} \setminus [\Lambda_0, +\infty)$, we use a local approach by transforming locally the problem to $\mathbb{D}$ using a conformal map.

4.2. About the conformal map $\varphi(z)$.

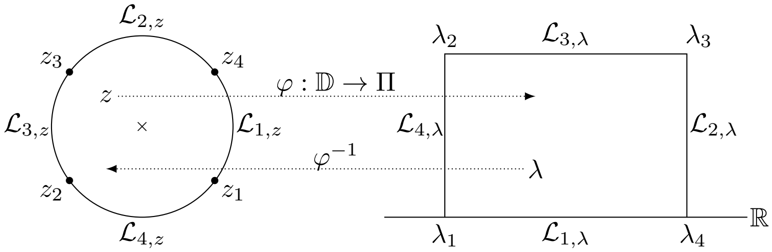
Let $\Pi = \mathcal{R}(\lambda_1, \lambda_2, \lambda_3, \lambda_4)$ be a rectangle (or a square) with vertices λ_1, $\lambda_4 \in \mathbb{R}$, and λ_2, $\lambda_3 \in \mathbb{C}_+$ or λ_2, $\lambda_3 \in \mathbb{C}_-$ (see the figure below). It is well known (see e.g. [16] Theorem 1, p. 176), that there exists a conformal map $\varphi : \mathbb{D} \to \Pi$ given by Schwarz-Christoffel formula. Denote by

$$\mathbb{T} := \partial\mathbb{D} = \{z \in \mathbb{C} : |z| = 1\},$$

and let $z_j \in \mathbb{T}$ be the points such that $\varphi(z_j) = \lambda_j$, for $1 \leq j \leq 4$. Since Π is a rectangle, the map φ satisfies

$$\varphi'(z) = \frac{C}{(z - z_1)^{\frac{1}{2}}(z - z_2)^{\frac{1}{2}}(z - z_3)^{\frac{1}{2}}(z - z_4)^{\frac{1}{2}}} \tag{4.11}$$

where C is a constant.



We write $\lambda = \varphi(z) = \lambda(z)$ or $z = \varphi^{-1}(\lambda) = z(\lambda)$. We have $\varphi(\mathcal{L}_{j,z}) = \mathcal{L}_{j,\lambda}$ and $\partial\Pi = \bigcup_j \mathcal{L}_{j,\lambda}$. We set also $\mathcal{F}_z := \{z_j\}_j$ and $\mathcal{F}_\lambda := \{\lambda_j\}_j$ so that $\varphi(\mathcal{F}_z) = \mathcal{F}_\lambda$. Elsewhere in this paper, $\mathcal{P} \simeq \mathcal{Q}$ means that there exist constants C_1, C_2 such that

$$0 < C_1 \leq \frac{\mathcal{P}}{\mathcal{Q}} \leq C_2 < \infty. \tag{4.12}$$

Lemma 4.2. *For $z \in \mathbb{D}$ and $\lambda \in \Pi$, the following holds:*

$$\operatorname{dist}(\lambda, \partial\Pi) \simeq \operatorname{dist}(z, \mathbb{T}) \frac{1}{\operatorname{dist}(z, \mathcal{F}_z)^{\frac{1}{2}}}$$

or equivalently

$$\operatorname{dist}(z, \mathbb{T}) \simeq \operatorname{dist}(\lambda, \partial\Pi) \operatorname{dist}(\lambda, \mathcal{F}_\lambda).$$

Proof. Follows directly from Corollary 1.4 of [19] and (4.11). ■

In the sequel, we are interested in the same quantities where $\operatorname{dist}(z, \mathbb{T})$ and $\operatorname{dist}(\lambda, \partial\Pi)$ are respectively replaced by $\operatorname{dist}(z, \mathcal{L}_{1,z})$ and $\operatorname{dist}(\lambda, \mathcal{L}_{1,\lambda})$. As in Lemma 4.2, we have

$$\begin{aligned} \operatorname{dist}(\lambda, \mathcal{L}_{1,\lambda}) &\simeq \operatorname{dist}(z, \mathcal{L}_{1,z}) \frac{1}{\operatorname{dist}\big(z, \{z_1, z_4\}\big)^{\frac{1}{2}}} \\ \operatorname{dist}(z, \mathcal{L}_{1,z}) &\simeq \operatorname{dist}(\lambda, \mathcal{L}_{1,\lambda}) \operatorname{dist}\big(\lambda, \{\lambda_1, \lambda_4\}\big). \end{aligned} \tag{4.13}$$

4.3. **About a theorem in** [3]**.** The following result by A. Borichev, L. Golinskii and S. Kupin is proved in [3]. It gives an estimate on zeros of holomorphic functions in the unit disk $\mathbb{D}$.

Theorem 4.1. *Let h be a holomorphic function in the unit disk $\mathbb{D}$ with $h(0) = 1$. Assume that h satisfies a bound of the form*

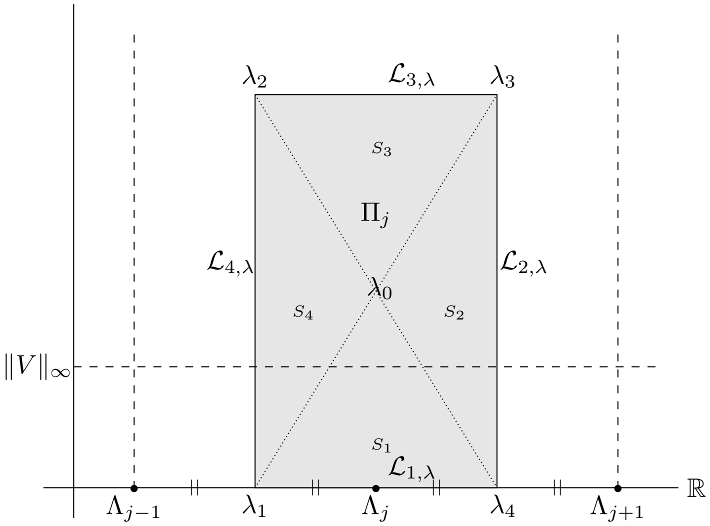
$$\log|h(z)| \leq K_0 \frac{1}{(1 - |z|)^\alpha} \prod_{j=1}^{N} \frac{1}{|z - \xi_j|^{\beta_j}},$$

where $\xi_j \in \mathbb{T}$ and α, $\beta_j \geq 0$. Let $\tau > 0$. Then the zeros of h satisfy the inequality

$$\sum_{\{h(z)=0\}} (1 - |z|)^{\alpha+1+\tau} \prod_{j=1}^{N} |z - \xi_j|^{(\beta_j - 1 + \tau)_+} \leq C\big(\alpha, \{\beta_j\}, \{\xi_j\}, \tau\big) K_0.$$

5. Bounds on eigenvalues of H

5.1. **Local bound.** Let us recall that the Λ_j are the Landau levels given by (1.3). In this subsection, we prove a bound on $\lambda \in \sigma_d(H)$ in a rectangle Π_j containing one Landau level Λ_j (see the figure below). We treat only the case $\lambda \in \sigma_d(H) \cap \mathbb{C}_+$. The same is true for $\lambda \in \sigma_d(H) \cap \mathbb{C}_-$ by considering rectangles Π_j in the half plane $\mathbb{C}_-$. For simplicity in the sequel, by λ_0 we mean $\lambda_{0,j} \in \Pi_j$ and we assume that it satisfies condition (3.19).



We have $\varphi_j(1) = \Lambda_j$ and $\varphi_j(0) = \lambda_0$ where $\varphi_j : \mathbb{D} \to \Pi_j$ is the conformal map defined in the Subsection 4.2 for the rectangle Π_j. The four triangles S_k, $1 \leq k \leq 4$ form a partition of the rectangle Π_j. Let f be the function defined by (4.6) and define $h_j : \mathbb{D} \to \mathbb{C}$ by

$$h_j(z) = f(\varphi_j(z)) \quad \text{and} \quad \tilde{h}_j(z) = \frac{h_j(z)}{h_j(0)}. \tag{5.1}$$

Then $\tilde{h}_j$ is holomorphic in the unit disk and (4.7) implies that

$$\sigma_d(H) \cap \Pi_j = \{\varphi_j(z) \in \Pi_j : z \in \mathbb{D} : \tilde{h}_j(z) = 0\}. \tag{5.2}$$

We have the following lemma.

Lemma 5.1. *Under the assumptions of Lemma* 4.1, *for any* $z \in \mathbb{D}$,

$$\log|\tilde{h}_j(z)| \leq \frac{C(p,b,d,j)K_3}{\operatorname{dist}\big(z,\mathbb{T}\big)^{\frac{p}{2}}\,|z-1|^{\frac{p}{4}}}, \tag{5.3}$$

where the constant $C(p,b,d,j)$ *satisfies the asymptotic property*

$$C(p,b,d,j) \underset{j\to\infty}{\sim} j^{d+\frac{1}{2}}, \tag{5.4}$$

and the constant K_3 *is defined by*

$$K_3 := \|F\|_{L^p}^p \big(\|G\|_{L^2} + \|G\|_{L^\infty}\big)^p \big(1 + \|V\|_\infty\big)^{d+\frac{1}{2}}. \tag{5.5}$$

Proof. Constants are generic (changing from a relation to another). Let K_1 be the constant defined by (3.5). For λ, $\lambda_0 = \lambda_{0,j} \in \Pi_j$ with λ_0 satisfying condition (3.19), using (1.3) we get the inequality

$$\begin{aligned} &\frac{\Gamma_p C(p,b,d) K_1 (1+|\lambda|)^{d+\frac{1}{2}}}{\operatorname{dist}\big(\lambda,[\Lambda_0,+\infty)\big)^{\frac{p}{2}} \operatorname{dist}(\lambda,E)^{\frac{p}{4}}} + \Gamma_p C(p) K_1 (1+|\lambda_0|)^{d+\frac{1}{2}} \\ &\le \frac{\Gamma_p C(p,b,d) K_3 (1+j)^{d+\frac{1}{2}}}{\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}} |\lambda-\Lambda_j|^{\frac{p}{4}}} + \Gamma_p C(p) K_3 (1+j)^{d+\frac{1}{2}}. \end{aligned} \tag{5.6}$$

Since $\varphi_j(z) = \lambda$ and $\varphi_j(1) = \Lambda_j$, (4.13) (or Lemma 4.2) implies that

$$\begin{aligned} \frac{\Gamma_p C(p,b,d) K_3 (1+j)^{d+\frac{1}{2}}}{\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}} |\lambda-\Lambda_j|^{\frac{p}{4}}} &\simeq \frac{C(p,d,j) K_3 \operatorname{dist}\big(z,\{z_1,z_4\}\big)^{\frac{p}{4}}}{\operatorname{dist}\big(z,\mathbb{T}\big)^{\frac{p}{2}} |z-1|^{\frac{p}{4}}} \\ &\le \frac{C(p,d,j) K_3}{\operatorname{dist}\big(z,\mathbb{T}\big)^{\frac{p}{2}} |z-1|^{\frac{p}{4}}}. \end{aligned}$$

This together with (5.6) show that for any $\lambda \in \Pi_j$,

$$\begin{aligned} &\frac{\Gamma_p C(p,b,d) K_1 (1+|\lambda|)^{d+\frac{1}{2}}}{\operatorname{dist}\big(\lambda,[\Lambda_0,+\infty)\big)^{\frac{p}{2}} \operatorname{dist}(\lambda,E)^{\frac{p}{4}}} + \Gamma_p C(p) K_1 (1+|\lambda_0|)^{d+\frac{1}{2}} \\ &\le \frac{C(p,b,d,j) K_3}{\operatorname{dist}\big(z,\mathbb{T}\big)^{\frac{p}{2}} |z-1|^{\frac{p}{4}}} + C(p,d,j) K_3 \\ &\le \frac{C(p,b,d,j) K_3}{\operatorname{dist}\big(z,\mathbb{T}\big)^{\frac{p}{2}} |z-1|^{\frac{p}{4}}}. \end{aligned} \tag{5.7}$$

Now (5.3) follows from Lemma 4.1, (5.1) and (5.7). ∎

Applying Theorem 4.1 to $\tilde{h}_j$ satisfying (5.3) in Lemma 5.1, for any $0 < \varepsilon < 1$

$$\sum_{\{\tilde{h}_j(z)=0\}} \operatorname{dist}\big(z,\mathbb{T}\big)^{\frac{p}{2}+1+\varepsilon} |z-1|^{(\frac{p}{4}-1+\varepsilon)_+} \le C(p,d,j,\varepsilon) K_3. \tag{5.8}$$

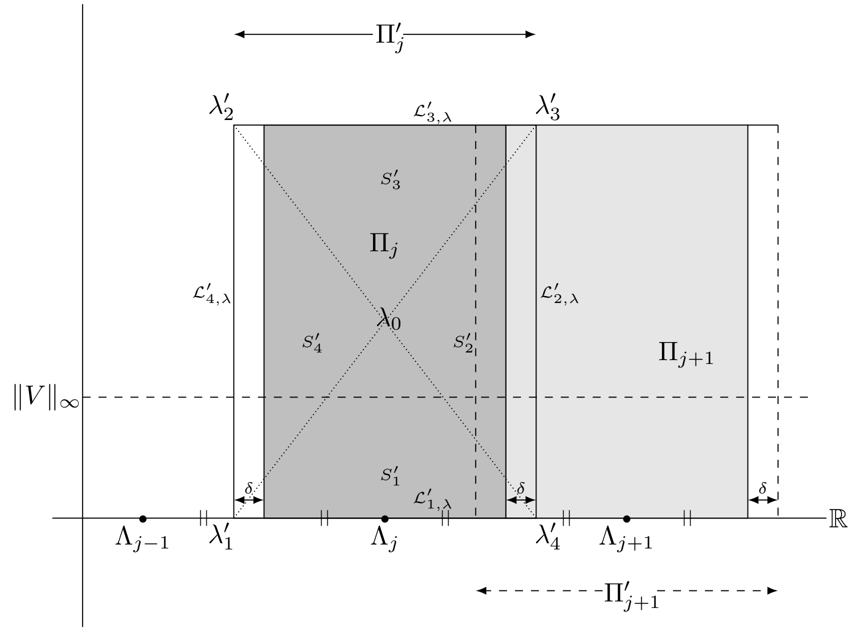
Equivalently, using Lemma 4.2, estimate (5.8) can be rewritten in Π_j as

$$\sum_{\lambda \in \sigma_d(H) \cap \Pi_j} \Big(\operatorname{dist}\big(\lambda,\partial\Pi_j\big) \operatorname{dist}\big(\lambda,\mathcal{F}_\lambda\big)\Big)^{\frac{p}{2}+1+\varepsilon} |\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+} \le C(p,d,j,\varepsilon) K_3. \tag{5.9}$$

where the constant $C(p,d,j,\varepsilon)$ satisfies again the asymptotic property (5.4) above. In the sequel we want to derive from (5.9) a bound of the quantity

$$\sum_{\lambda \in \sigma_d(H) \cap \Pi_j} \operatorname{dist}\big(\lambda,[\Lambda_0,+\infty)\big)^{\frac{p}{2}+1+\varepsilon} \operatorname{dist}(\lambda,E)^{(\frac{p}{4}-1+\varepsilon)_+}. \tag{5.10}$$

Note that in (5.9), we can have accumulation of $\lambda \in \sigma_d(H)$ on the edges $\mathcal{L}_{2,\lambda}$ and $\mathcal{L}_{4,\lambda}$ of the boundary $\partial\Pi_j$ of Π_j. This is not due to the nature of the problem, but to the method we use. To treat this problem appearing in (5.9), the idea is to deal for any rectangle Π_j with its magnified version Π_j' in the horizontal direction as in the figure below, where the constant δ is such that $0 < \delta < b$.



In the figure above, we introduce a partition of the rectangle Π'_j by the four triangles S'_k, $1 \leq k \leq 4$. Applying (5.9) to the rectangle Π'_j, we get

$$\sum_{\lambda \in \sigma_d(H) \cap \Pi'_j} \Big(\text{dist}\big(\lambda, \partial \Pi'_j\big) \, \text{dist}\big(\lambda, \mathcal{F}_{\lambda'}\big) \Big)^{\frac{p}{2}+1+\varepsilon} |\lambda - \Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+} \leq C(p,b,d,j,\varepsilon) K_3.$$

Since $\Pi_j \subset \Pi'_j$, then the sum taken on Π_j gives

$$\sum_{\lambda \in \sigma_d(H) \cap \Pi_j} \Big(\text{dist}\big(\lambda, \partial \Pi'_j\big) \, \text{dist}\big(\lambda, \mathcal{F}_{\lambda'}\big) \Big)^{\frac{p}{2}+1+\varepsilon} |\lambda - \Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+} \leq C(p,b,d,j,\varepsilon) K_3. \tag{5.11}$$

Otherwise, since there is no eigenvalues in the sector S'_3, we have

$$\begin{aligned}
&\sum_{\lambda \in \sigma_d(H) \cap \Pi_j} \Big(\text{dist}\big(\lambda, \partial \Pi'_j\big) \, \text{dist}\big(\lambda, \mathcal{F}_{\lambda'}\big) \Big)^{\frac{p}{2}+1+\varepsilon} |\lambda - \Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+} = \\
&\qquad \sum_{\lambda \in \sigma_d(H) \cap \Pi_j \cap S'_1} \Big(\text{dist}\big(\lambda, \mathcal{L}'_{1,\lambda}\big) \, \text{dist}\big(\lambda, \{\lambda'_1, \lambda'_4\}\big) \Big)^{\frac{p}{2}+1+\varepsilon} |\lambda - \Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+} \\
&\qquad + \sum_{\lambda \in \sigma_d(H) \cap \Pi_j \cap S'_2} \Big(\text{dist}\big(\lambda, \mathcal{L}'_{2,\lambda}\big) \, \text{dist}\big(\lambda, \{\lambda'_4, \lambda'_3\}\big) \Big)^{\frac{p}{2}+1+\varepsilon} |\lambda - \Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+} \\
&\qquad + \sum_{\lambda \in \sigma_d(H) \cap \Pi_j \cap S'_4} \Big(\text{dist}\big(\lambda, \mathcal{L}'_{4,\lambda}\big) \, \text{dist}\big(\lambda, \{\lambda'_2, \lambda'_1\}\big) \Big)^{\frac{p}{2}+1+\varepsilon} |\lambda - \Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}.
\end{aligned} \tag{5.12}$$

This together with (5.11) implies in particular that

$$\sum_{\lambda\in\sigma_d(H)\cap\Pi_j\cap S_2'}\Big(\operatorname{dist}\big(\lambda,\mathcal{L}_{2,\lambda}'\big)\operatorname{dist}\big(\lambda,\{\lambda_4',\lambda_3'\}\big)\Big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}\le C(p,b,d,j,\varepsilon)K_3,$$
$$\sum_{\lambda\in\sigma_d(H)\cap\Pi_j\cap S_4'}\Big(\operatorname{dist}\big(\lambda,\mathcal{L}_{4,\lambda}'\big)\operatorname{dist}\big(\lambda,\{\lambda_2',\lambda_1'\}\big)\Big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}\le C(p,b,d,j,\varepsilon)K_3. \tag{5.13}$$

Take into account the fact that there is no eigenvalues in the sector S_3', clearly quantity (5.10) above can be rewritten as

$$\begin{aligned}\sum_{\lambda\in\sigma_d(H)\cap\Pi_j}&\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}=\\ &\sum_{\lambda\in\sigma_d(H)\cap\Pi_j\cap S_1'}\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}\\ &+\sum_{\lambda\in\sigma_d(H)\cap\Pi_j\cap S_2'}\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}\\ &+\sum_{\lambda\in\sigma_d(H)\cap\Pi_j\cap S_4'}\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}.\end{aligned}\tag{5.14}$$

By combining (5.11) and (5.12), and using the first term of RHS in (5.12) and the lower bound $\operatorname{dist}\big(\lambda,\{\lambda_1',\lambda_4'\}\big)\ge\delta$, we get the following bound

$$\sum_{\lambda\in\sigma_d(H)\cap\Pi_j\cap S_1'}\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}\le\frac{C(p,b,d,j,\varepsilon)K_3}{\delta^{\frac{p}{2}+1+\varepsilon}}.\tag{5.15}$$

For $\lambda\in\sigma_d(H)\cap\Pi_j\cap S_2'$, it can be easily checked that $\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)\le\|V\|_\infty$ and $\operatorname{dist}\big(\lambda,\mathcal{L}_{2,\lambda}'\big)\operatorname{dist}\big(\lambda,\{\lambda_4',\lambda_3'\}\big)\ge\delta^2$. Thus

$$\begin{aligned}&\sum_{\lambda\in\sigma_d(H)\cap\Pi_j\cap S_2'}\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}\\ &\le\frac{\|V\|_\infty^{\frac{p}{2}+1+\varepsilon}}{\delta^{2(\frac{p}{2}+1+\varepsilon)}}\sum_{\lambda\in\sigma_d(H)\cap\Pi_j\cap S_2'}\Big(\operatorname{dist}\big(\lambda,\mathcal{L}_{2,\lambda}'\big)\operatorname{dist}\big(\lambda,\{\lambda_4',\lambda_3'\}\big)\Big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}.\end{aligned}$$

Now using (5.13) we get the bound

$$\sum_{\lambda\in\sigma_d(H)\cap\Pi_j\cap S_2'}\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}\le C(p,b,d,j,\varepsilon)K\tag{5.16}$$

where the constant K is defined by (2.1). By similar arguments, we show that

$$\sum_{\lambda\in\sigma_d(H)\cap\Pi_j\cap S_4'}\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}\le C(p,b,d,j,\varepsilon)K\tag{5.17}$$

For the rectangle Π_0 containing the first Landau level Λ_0, choose the vertice λ_1 of the edge $\mathcal{L}_{4,\lambda}$ so that $\lambda_1\le-\|V\|_\infty$. Then estimates (5.14)-(5.17) imply that for any $j\ge0$

$$\sum_{\lambda\in\sigma_d(H)\cap\Pi_j}\operatorname{dist}\big(\lambda,\mathcal{L}_{1,\lambda}\big)^{\frac{p}{2}+1+\varepsilon}|\lambda-\Lambda_j|^{(\frac{p}{4}-1+\varepsilon)_+}\le C(p,b,d,j,\varepsilon)K.\tag{5.18}$$

Thus we have proved the following proposition.

Proposition 5.1. *For any $j \geq 0$ the following bound*

$$\sum_{\lambda \in \sigma_d(H) \cap \Pi_j} \operatorname{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{p}{2}+1+\varepsilon} \operatorname{dist}(\lambda, E)^{(\frac{p}{4}-1+\varepsilon)_+} \leq C(p,b,d,j,\varepsilon) K \tag{5.19}$$

holds, where K is defined by (2.1) *and the constant $C(p,b,d,j,\varepsilon)$ satisfies the asymptotic property* (5.4)*.*

Now we go back to the global bound.

5.2. **Proof of Theorem 2.1.** The main idea is to do with the help of (5.19) a summation on the index j. The only way to obtain a finite sum with respect to j is first to multiply (5.19) by an appropriate weight fonction of j, taking into account the asymptotic property (5.4) of the constant $C(p,b,d,j,\varepsilon)$:

$$C(p,b,d,j,\varepsilon) \underset{j \to \infty}{\sim} j^{d+\frac{1}{2}}.$$

Let γ be such that $\gamma - (d + \frac{1}{2}) > 1$ or equivalently $\gamma > d + \frac{3}{2}$. By (5.19), we have

$$\begin{aligned} \frac{1}{(1+j)^\gamma} \sum_{\lambda \in \sigma_d(H) \cap \Pi_j} & \operatorname{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{p}{2}+1+\varepsilon} \operatorname{dist}(\lambda, E)^{(\frac{p}{4}-1+\varepsilon)_+} \\ & \leq \frac{C(p,b,d,j,\varepsilon)}{(1+j)^\gamma} K. \end{aligned} \tag{5.20}$$

Taking in (5.20) the sum with respect to j, we get

$$\begin{aligned} \sum_j \frac{1}{(1+j)^\gamma} \sum_{\lambda \in \sigma_d(H) \cap \Pi_j} & \operatorname{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{p}{2}+1+\varepsilon} \operatorname{dist}(\lambda, E)^{(\frac{p}{4}-1+\varepsilon)_+} \\ & \leq \sum_j \frac{C(p,b,d,j,\varepsilon)}{(1+j)^\gamma} K. \end{aligned} \tag{5.21}$$

By the above choice of γ, RHS in (5.21) is convergent so that

$$\sum_j \frac{C(p,b,d,j,\varepsilon)}{(1+j)^\gamma} K = C(p,b,d,\varepsilon) K. \tag{5.22}$$

Thus using the fact that for any $\lambda \in \Pi_j$ we have $1 + j \simeq 1 + |\lambda|$, we get

$$\sum_{\lambda \in \sigma_d(H) \cap \mathbb{C}_+} \frac{\operatorname{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{p}{2}+1+\varepsilon} \operatorname{dist}(\lambda, E)^{(\frac{p}{4}-1+\varepsilon)_+}}{(1+|\lambda|)^\gamma} \leq C_0 K \tag{5.23}$$

where $C_0 = C(p,b,d,\varepsilon)$. Since (5.23) is true for $\lambda \in \sigma_d(H) \cap \mathbb{C}_-$ by considering rectangles Π_j in the half plane $\mathbb{C}_-$, then finally we have

$$\sum_{\lambda \in \sigma_d(H)} \frac{\operatorname{dist}\big(\lambda, [\Lambda_0, +\infty)\big)^{\frac{p}{2}+1+\varepsilon} \operatorname{dist}(\lambda, E)^{(\frac{p}{4}-1+\varepsilon)_+}}{(1+|\lambda|)^\gamma} \leq C_0 K. \tag{5.24}$$

This concludes the proof of Theorem 2.1.

6. About the dimension $2d$, $d \geq 1$

Consider the Schrödinger operator $H_{0,\perp}$ defined by (1.1). In this section, we investigate the discrete spectrum $\sigma_d(H_\perp)$ of the perturbed operator $H_\perp$ defined by (1.4), and we assume that the electric potential V satisfies assumption (1.6) for $n = 2d$.

6.1. Estimate of the resolvent.

Recall that the spectrum $\sigma(H_{0,\perp})$ of $H_{0,\perp}$ is a discrete set and consists of the Landau levels Λ_j defined by (1.3), $j \in \mathbb{N}$. So for any $\lambda \in \mathbb{C} \setminus \sigma(H_{0,\perp})$ the resolvent of $H_{0,\perp}$ is given by

$$(H_{0,\perp} - \lambda)^{-1} = \sum_{j \in \mathbb{N}} (\Lambda_j - \lambda)^{-1} p_j, \tag{6.1}$$

where p_j is the orthogonal projection onto $\ker(H_{0,\perp} - \Lambda_j)$.

Lemma 6.1. *Let $n = 2d$, $d \geq 1$ and $\lambda \in \mathbb{C} \setminus E$ where E is the set of Landau levels defined by* (1.3). *Assume that $F \in L^p(\mathbb{R}^n)$ with $p \geq 2\left[\frac{d}{2}\right] + 2$. Then there exists a constant $C = C(p)$ such that*

$$\left\| F(H_{0,\perp} - \lambda)^{-1} \right\|_p^p \leq \frac{C(1+|\lambda|)^d \|F\|_{L^p}^p}{\operatorname{dist}(\lambda, E)^p}. \tag{6.2}$$

Proof. Let $\lambda \in \mathbb{C} \setminus E$. We first show that (6.2) holds if p is even. Using the identity

$$(H_{0,\perp} - \lambda)^{-1} = \left(H_{0,\perp} + 1 + |\lambda|\right)^{-1} \left((1 + |\lambda| + \lambda)(H_{0,\perp} - \lambda)^{-1} + I\right),$$

one gets

$$\begin{aligned} \left\| F(H_{0,\perp} - \lambda)^{-1} \right\|_p^p \leq & \left\| F\left(H_{0,\perp} + 1 + |\lambda|\right)^{-1} \right\|_p^p \\ & \times \left\| \left((1 + |\lambda| + \lambda)(H_{0,\perp} - \lambda)^{-1} + I\right) \right\|^p. \end{aligned} \tag{6.3}$$

Hence if p is even, (6.2) follows as in the proof of Lemma 3.1 from (3.7) to (3.10), where the operator H_0 is replaced by $H_{0,\perp}$, D_x^2 is removed and $G = I$.

To prove that (6.2) holds for any $p \geq 2\left[\frac{d}{2}\right] + 2$, we interpolate by the Riesz-Thorin Theorem as in (ii) of the proof of Lemma 3.1. This concludes the proof. ■

6.2. Proof of Theorem 2.2.

Constants are generic (changing from a relation to another). The first important tool of the proof is the following result of Hansmann (see [13], Theorem 1). Let $A_0 = A_0^*$ be a bounded selfadjoint operator on a Hilbert space, A a bounded operator such that $A - A_0 \in S_p$, $p > 1$. Then

$$\sum_{\lambda \in \sigma_d(A)} \operatorname{dist}\left(\lambda, \sigma(A_0)\right)^p \leq C \|A - A_0\|_p^p, \tag{6.4}$$

where C is an explicit constant which depends only on p.

Now let us fix a constant μ defined by

$$\mu := -\|V\|_\infty - 1. \tag{6.5}$$

Since $H_{0,\perp}$ and $H_\perp$ are not bounded operators, to apply (6.4) we will consider the bounded resolvents

$$A_0(\mu) := (H_{0,\perp} - \mu)^{-1} \quad \text{and} \quad A(\mu) := (H_\perp - \mu)^{-1}. \tag{6.6}$$

The assumption (1.6) on V for $n = 2d$ implies that for any $X_\perp \in \mathbb{R}^n$, $V(X_\perp) = \mathcal{V}F(X_\perp)$ where $\mathcal{V}$ is a bounded operator. So using the resolvent equation

$$(H_\perp - \mu)^{-1} - (H_{0,\perp} - \mu)^{-1} = -(H_\perp - \mu)^{-1} V (H_{0,\perp} - \mu)^{-1},$$

we get

$$\big\| A(\mu) - A_0(\mu) \big\|_p^p \leq C \big\| (H_\perp - \mu)^{-1} \big\|^p \big\| F(H_{0,\perp} - \mu)^{-1} \big\|_p^p, \tag{6.7}$$

with $C > 0$ a constant. The choice of the constant μ and (1.5) imply that $\text{dist}\big(\mu, \overline{N(H_\perp)}\big) \geq 1$, and by Lemma 9.3.14 of [5]

$$\big\| (H_\perp - \mu)^{-1} \big\| \leq \frac{1}{\text{dist}\big(\mu, \overline{N(H_\perp)}\big)} \leq 1. \tag{6.8}$$

Lemma 6.1 and the choice of μ imply that

$$\| F(H_{0,\perp} - \mu)^{-1} \big\|_p^p \leq C \|F\|_{L^p}^p. \tag{6.9}$$

By combining (6.7), (6.8) and (6.9), we finally get

$$\big\| A(\mu) - A_0(\mu) \big\|_p^p \leq C \|F\|_{L^p}^p. \tag{6.10}$$

Hence by applying (6.4) to the resolvents $A(\mu)$ and $A_0(\mu)$, we get

$$\sum_{z \in \sigma_d(A(\mu))} \text{dist}\big(z, \sigma(A_0(\mu))\big)^p \leq C \|F\|_{L^p}^p, \tag{6.11}$$

where $C = C(p)$. Let $z = \varphi_\mu(\lambda) = (\lambda - \mu)^{-1}$. The Spectral Mapping Theorem implies that

$$z \in \sigma_d\big(A(\mu)\big) \quad \Big(z \in \sigma\big(A_0(\mu)\big) \Big) \quad \Longleftrightarrow \quad \lambda \in \sigma_d(H_\perp) \quad \Big(\lambda \in \sigma(H_{0,\perp}) \Big). \tag{6.12}$$

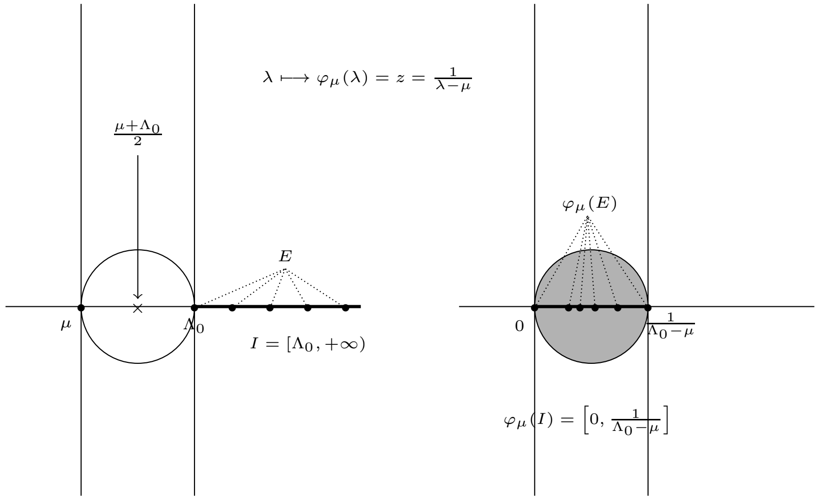
The second ingredient of the proof of the theorem is the following distorsion lemma for the transformation $z = \varphi_\mu(\lambda) = (\lambda - \mu)^{-1}$.

Lemma 6.2. *Let μ be the constant defined by* (6.5) *and E be the set of Landau levels defined by* (1.3). *Then the following bound holds*

$$\text{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(E)\big) \geq \frac{C\, \text{dist}\big(\lambda, E\big)}{\big(1 + \|V\|_\infty\big)^2 \big(1 + |\lambda|\big)^2}, \quad \lambda \in \mathbb{C}, \tag{6.13}$$

where $C = C(b, d)$ is a constant depending on b and d.

The proof of Lemma 6.2 follows directly from Lemma 6.3 and Lemma 6.4 below. For more comprehension in the sequel, it is convenient to give the figure which represents the transformation of the complex plane by the conformal map φ_μ (see the figure below).



$\lambda \longmapsto \varphi_\mu(\lambda) = z = \frac{1}{\lambda-\mu}$
$\frac{\mu+\Lambda_0}{2}$
E
μ
Λ_0
$I = [\Lambda_0, +\infty)$
$\varphi_\mu(E)$
0
$\frac{1}{\Lambda_0-\mu}$
$\varphi_\mu(I) = \left[0, \frac{1}{\Lambda_0-\mu}\right]$

It can be easily checked that

$$\varphi_\mu\Big(\big\{\lambda \in \mathbb{C} : \operatorname{Re}\lambda < \mu\big\}\Big) = \big\{z \in \mathbb{C} : \operatorname{Re} z < 0\big\}, \tag{6.14}$$

$$\varphi_\mu\left(\left\{\lambda \in \mathbb{C} : \left|\lambda - \frac{\mu+\Lambda_0}{2}\right| \le \frac{\Lambda_0-\mu}{2}\right\}\right) = \left\{z \in \mathbb{C} : \operatorname{Re} z \ge \frac{1}{\Lambda_0-\mu}\right\}, \tag{6.15}$$

$$\varphi_\mu\Big(\big\{\mu \le \operatorname{Re}\lambda \le \Lambda_0\big\}\Big) = \big\{z \in \mathbb{C} : \operatorname{Re} z \ge 0\big\} \cap \text{outside the gray disk}, \tag{6.16}$$

$$\varphi_\mu\Big(\big\{\lambda \in \mathbb{C} : \operatorname{Re}\lambda \ge \Lambda_0\big\}\Big) = \left\{z : \left|z - \frac{1}{2(\Lambda_0-\mu)}\right| \le \frac{1}{2(\Lambda_0-\mu)}\right\}. \tag{6.17}$$

Lemma 6.3. *Let $I = [\Lambda_0, +\infty)$. The following bound holds for any $\lambda \in \mathbb{C}$*

$$\operatorname{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(I)\big) \ge \frac{C \operatorname{dist}\big(\lambda, I\big)}{\big(1+\|V\|_\infty\big)^2\big(1+|\lambda|\big)^2}, \tag{6.18}$$

where $C = C(b,d)$ is a constant depending on b and d.

Proof. It suffices to show that (6.18) holds for λ in each of the four sectors defined by (6.14)-(6.17). For further use in this proof, let us recall that the relation $\simeq$ is defined by (4.12).

- For $\big\{\lambda \in \mathbb{C} : \operatorname{Re}\lambda < \mu\big\}$, we have $\operatorname{dist}\big(\lambda, I\big) = |\lambda - \Lambda_0|$ and by (6.14) $\operatorname{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(I)\big) = |\varphi_\mu(\lambda)| = \frac{1}{|\lambda-\mu|}$. Then

$$\frac{\operatorname{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(I)\big)}{\operatorname{dist}\big(\lambda, I\big)} = \frac{1}{|\lambda-\mu||\lambda-\Lambda_0|}.$$

So (6.18) holds since $|\lambda - \Lambda_0| \le C\big(1+|\lambda|\big)$ and $|\lambda-\mu| \le C\big(1+\|V\|_\infty\big)\big(1+|\lambda|\big)$.

- For $\lambda \in \Big\{ \Big| \lambda - \frac{\mu + \Lambda_0}{2} \Big| \leq \frac{\Lambda_0 - \mu}{2} \Big\}$, we have $\text{dist}\big(\lambda, I\big) = |\lambda - \Lambda_0|$ and by (6.15)

$$\text{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(\lambda)\big) = \Big| \varphi_\mu(\lambda) - \frac{1}{\Lambda_0 - \mu} \Big| \\ = \frac{\text{dist}\big(\lambda, I\big)}{|\lambda - \mu| |\Lambda_0 - \mu|}.$$

Then (6.18) holds since as above $|\lambda - \mu| \leq C\big(1 + \|V\|_\infty\big)\big(1 + |\lambda|\big)$ and $|\Lambda_0 - \mu| \leq C\big(1 + \|V\|_\infty\big)$.

- For $\lambda \in \big\{ \mu \leq \text{Re}\, \lambda \leq \Lambda_0 \big\} \setminus \Big\{ \Big| \lambda - \frac{\mu + \Lambda_0}{2} \Big| \leq \frac{\Lambda_0 - \mu}{2} \Big\}$, we have $\text{dist}\big(\lambda, I\big) = |\lambda - \Lambda_0|$ and by (6.15)-(6.16)

$$\text{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(I)\big) = |\text{Im}\, \varphi_\mu(\lambda)| = \frac{|\text{Im}\, \lambda|}{|\lambda - \mu|^2}.$$

$*$ For λ closed to μ in this domain, $\text{dist}\big(\lambda, I\big) \simeq$ constant and $|\text{Im}\, \lambda| \simeq |\lambda - \mu|$ so that $\text{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(I)\big) \simeq \frac{1}{|\lambda - \mu|}$. Then (6.18) holds as above.

$*$ For λ closed to Λ_0, $\text{dist}\big(\lambda, I\big) = |\lambda - \Lambda_0|$, $|\text{Im}\, \lambda| \simeq |\lambda - \Lambda_0|$ and $|\lambda - \mu|^2 \simeq$ constant so that $\text{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(I)\big) \simeq |\lambda - \Lambda_0|$. Then (6.18) holds.

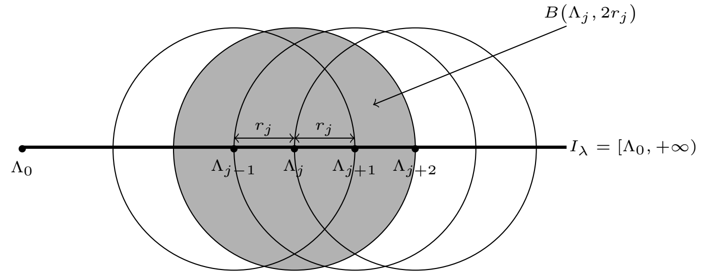
$*$ When $|\lambda| \to +\infty$, $\text{Im}\, \lambda \simeq |\lambda - \Lambda_0|$ so that $\text{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(I)\big) \simeq \frac{|\lambda - \Lambda_0|}{|\lambda - \mu|^2}$. Then (6.18) holds as above.

- For $\lambda \in \big\{ \lambda \in \mathbb{C} : \text{Re}\, \lambda \geq \Lambda_0 \big\}$, we have $\text{dist}\big(\lambda, I\big) = |\text{Im}\, \lambda|$ and by (6.17)

$$\text{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(I)\big) = |\text{Im}\, \varphi_\mu(\lambda)| = \frac{|\text{Im}\, \lambda|}{|\lambda - \mu|^2} = \frac{\text{dist}\big(\lambda, I\big)}{|\lambda - \mu|^2}.$$

Then (6.18) holds as above. This concludes the proof of Lemma 6.3. ■

Now for futher use, let us introduce some notations. For $\Lambda_j \in E \subset I$, define $r_j = \text{dist}\big(\Lambda_j, E \setminus \{\Lambda_j\}\big)$, $A = \bigcup_j B\big(\Lambda_j, 2r_j\big)$ and $D = \mathbb{C} \setminus A$ (see the figure below). Corresponding notations on the plane of $z = \varphi_\mu(\lambda)$ are $\mathcal{A}$ and $\mathcal{D}$. That means for $\omega \in \varphi_\mu(E) = \Big\{ \frac{1}{\Lambda_j - \mu} \Big\}_j$, $r_\omega = \text{dist}\big(\omega, \varphi_\mu(E) \setminus \{\omega\}\big)$, $\mathcal{A} = \bigcup_\omega B\big(\omega, 2r_\omega\big)$ and $\mathcal{D} = \mathbb{C} \setminus \mathcal{A}$.



Note that by (1.3), we have $r_j = 2b$, $A = \bigcup_j B\big(\Lambda_j, 4b\big)$ and up to constant factor $\varphi_\mu(A) = \mathcal{A}$. We have the following lemma.

Lemma 6.4. *With the notations above, the following estimates hold.*

(i) *For any* $\lambda \in D$ *and any* $\varphi_\mu(\lambda) \in \mathcal{D}$,

$$\begin{aligned} &\frac{\operatorname{dist}\big(\lambda, E\big)}{2} \leq \operatorname{dist}\big(\lambda, I\big) \leq \operatorname{dist}\big(\lambda, E\big). \\ &\frac{\operatorname{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(E)\big)}{2} \leq \operatorname{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(I)\big) \leq \operatorname{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(E)\big). \end{aligned} \tag{6.19}$$

(ii) *For any* $\lambda \in A$,

$$\operatorname{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(E)\big) \geq \frac{C \operatorname{dist}\big(\lambda, E\big)}{\big(1 + \|V\|_\infty\big)^2 \big(1 + |\lambda|\big)^2}. \tag{6.20}$$

Proof. (i): We prove only the first estimate in (6.19). The same holds for the second. Obviously $\operatorname{dist}\big(\lambda, I\big) \leq \operatorname{dist}\big(\lambda, E\big)$. For $\lambda \in D$, let $\Lambda_j \in E$ such that

$$\operatorname{dist}\big(\lambda, E\big) = |\lambda - \Lambda_j| \geq 2r_j \quad \left(\Longleftrightarrow \frac{\operatorname{dist}\big(\lambda, E\big)}{2} \geq r_j\right). \tag{6.21}$$

Since $\operatorname{dist}\big(\lambda, E\big) \leq \operatorname{dist}\big(\lambda, I\big) + r_j$, *i.e.* $\operatorname{dist}\big(\lambda, E\big) - r_j \leq \operatorname{dist}\big(\lambda, I\big)$, then (6.21) implies that $\operatorname{dist}\big(\lambda, E\big) - \frac{\operatorname{dist}(\lambda, E)}{2} \leq \operatorname{dist}\big(\lambda, I\big)$. That means

$$\frac{\operatorname{dist}\big(\lambda, E\big)}{2} \leq \operatorname{dist}\big(\lambda, I\big).$$

(ii): Obviously all points $\lambda \in A$ are of the form $|\operatorname{Im} \lambda| \leq 4b$ and $\Lambda_j \leq \operatorname{Re} \lambda \leq \Lambda_{j+1}$ for some $\Lambda_j \in E$ such that $\operatorname{dist}\big(\lambda, E\big) = |\lambda - \Lambda_j|$ $\big($or $\operatorname{dist}\big(\lambda, E\big) = |\lambda - \Lambda_{j+1}|\big)$. For $\operatorname{dist}\big(\lambda, E\big) = |\lambda - \Lambda_j|$, we have

$$\operatorname{dist}\big(\varphi_\mu(\lambda), \varphi_\mu(E)\big) = \Big|\frac{1}{\lambda - \mu} - \frac{1}{\Lambda_j - \mu}\Big| = \frac{\operatorname{dist}\big(\lambda, E\big)}{|\lambda - \mu||\Lambda_j - \mu|}.$$

Then (6.20) holds since $|\lambda - \mu| \leq C\big(1 + \|V\|_\infty\big)\big(1 + |\lambda|\big)$ and $|\Lambda_j - \mu| \leq 2|\lambda - \mu|$ for $\operatorname{Re} \lambda > \Lambda_0$. This complete the proof. ■

Now we turn back to the proof of Theorem 2.2. Lemma 6.2 together with (6.11) and (6.12) show that

$$\sum_{z \in \sigma_d(H_\perp)} \frac{\operatorname{dist}\big(\lambda, E\big)^p}{\big(1 + |\lambda|\big)^{2p}} \leq C_1 \|F\|_{L^p}^p \big(1 + \|V\|_\infty\big)^{2p},$$

where $C_1 = C(p, b, d)$ is a constant depending on p, b and d. This complete the proof of Theorem 2.2.

Acknowledgments. This work is partially supported by ANR NOSEVOL-11-BS01-019 01. The author is grateful to V. Bruneau and S. Kupin for valuable discussions on the subject of this article.
